**Abstract:** A new epoxy-cadinane sesquiterpene, 4 $\beta$ ,5 $\beta$ -epoxycadinan-1 $\beta$ -ol (**1**), and six known cadinane sesquiterpenes: cadinan-1,4,5-triol (**2**), 4 $\alpha$ ,5 $\beta$ -dihydroxycubenol (**3**), cubenol (**4**), cadinan-3-ene-1,5-diol (**5**), cubenol-3-one (**6**), and torreyol (**7**), were isolated from a sample of marine brown alga *Dictyopteris divaricata* collected off the coast of Yantai (China). Their structures were established by detailed MS and NMR spectroscopic analysis, as well as comparison with literature data.

**Keywords:** *Dictyopteris divaricata*; sesquiterpene; cadinane

---

### 1. Introduction

Marine brown algae of the genus *Dictyopteris* (Dictyotales, Dictyotaceae) have been found to be a rich source of structurally unique sesquiterpenes, including cadinane, selinane, germacrane, and other rearranged skeleton types [1–9]. Continuing chemical investigation of the secondary metabolites of *D. divaricata* collected off the coast of Yantai has led to the isolation of one new cadinane sesquiterpene, 4 $\beta$ ,5 $\beta$ -epoxycadinan-1 $\beta$ -ol (**1**), and six known cadinane sesquiterpenes: cadinan-1,4,5-triol (**2**) [5], 4 $\alpha$ ,5 $\beta$ -dihydroxycubenol (**3**) [6], cubenol (**4**) [6], cadinan-3-ene-1,5-diol (**5**) [5], cubenol-3-one (**6**) [6], and torreyol (**7**) [6]. The isolation of compounds **1–7** and structural determination of compound **1** are presented.

## 2. Results and Discussion

The dried and powdered alga *D. divaricata* was extracted with a mixture of  $\text{CHCl}_3$  and MeOH (1:1, v/v). The concentrated extracts were partitioned between  $\text{H}_2\text{O}$  and EtOAc. The EtOAc-soluble fraction was purified by a combination of silica gel, reversed-phase silica gel, and Sephadex LH-20 column chromatography, as well as preparative TLC, to yield compounds **1-7** (Figure 1).

**Figure 1.** Structures of compounds **1-7**.

Compound **1** was obtained as a colorless oil. The IR absorption at  $\nu_{\text{max}}$  3471  $\text{cm}^{-1}$  indicated the presence of a hydroxyl group in the molecule. The molecular formula was determined as  $\text{C}_{15}\text{H}_{26}\text{O}_2$  on the basis of HRESIMS ( $m/z$  261.1825  $[\text{M}+\text{Na}]^+$ , calcd. for  $\text{C}_{15}\text{H}_{26}\text{O}_2\text{Na}$ , 261.1830), suggesting three degrees of unsaturation. The  $^1\text{H}$ -NMR spectrum displayed one methyl singlet, three methyl doublets, and two broad singlets attributed respectively to an oxygenated methine and a hydroxyl group. The  $^{13}\text{C}$ -NMR spectrum along with the DEPT and HSQC experiments revealed the presence of four methyls, four methylenes, five methines, and two quaternary carbon atoms. A detailed comparison of the above spectral data with those reported for cadinan-1,4,5-triol (**2**) revealed that **1** differed from **2** mainly at C-4 and C-5 [5], so **1** could be a dehydrated product of **2** between the hydroxyl groups at C-4 and C-5 according to the upfield-shifted C-4, C-5, and H-5 [10]. The  $^1\text{H}$ - $^1\text{H}$  COSY correlations as shown in Table 1 and the observed HMBC (Figure 2) correlations from H-12 to C-7, C-11, and C-13, from H-13 to C-7, C-11, and C-12, from H-14 to C-1, C-9, and C-10, from H-15 to C-3, C-4, and C-5, from H-5 to C-1, C-4, C-6, and C-15, and from HO-1 to C-1, C-6, and C-10 confirmed the gross structure of **1**.

The relative stereochemistry of **1** was determined by analysis of NOESY correlations (Figure 2) and coupling constants. The NOESY correlations between H-6 and H-2a, H-8a, H-10 indicated them to be axial and on the same face of the molecule. H-5 was located on the same face of H-6 and C-15 based on the NOESY correlation between H-5 and H-6, H-15 and the little coupling constant (only broad singlet) of H-5, while the large coupling constant (11.6 Hz) of H-6 suggested H-6 and H-7 to be opposite. The observed NOESY correlation between HO-1 and H-7 indicated them to be located on the

same face of the molecule. The above evidence established the structure of **1** to be 4 $\beta$ ,5 $\beta$ -epoxycadinan-1 $\beta$ -ol.

**Figure 2.** HMBC and NOESY correlations of compound **1**.

**Table 1.**  $^1\text{H}$  and  $^{13}\text{C}$ -NMR data and  $^1\text{H}$ - $^1\text{H}$  COSY correlations of compound **1** (in  $\text{CDCl}_3$ ,  $\delta$  values,  $J$  in Hz).

The structures of known compounds **2-7** were confirmed by detailed NMR data comparison with those in literature [5,6]. Compound **6** is firstly reported from *D. divaricata*, while **2-5**, **7** have been isolated from this species before [5,9,11]. When we tried to purify compound **1** by preparative TLC, **2** was by-produced. So, compound **2** may be an artifact, though it has been isolated from a different fraction (fraction VIII). Compound **1** represents a new addition to the molecular diversity of cadinane sesquiterpenes, which may be a key intermediate in the biosynthesis from **4** to **2** and **3**.

### 3. Experimental Section

#### 3.1. General

NMR spectra were recorded in  $\text{CDCl}_3$  at 500 and 125 MHz for  $^1\text{H}$  and  $^{13}\text{C}$ , respectively, on a Bruker Avance 500 MHz NMR spectrometer with TMS as internal standard. Mass spectra were determined on a VG Autospec 3000 mass spectrometer. IR spectrum was obtained on a JASCO FT/IR-4100 Fourier Transform InfraRed spectrometer. Optical rotation was measured on a JASCO P-1020 polarimeter. Column chromatography was performed with silica gel (200-300 mesh, Qingdao Haiyang Chemical Co., Qingdao, China), RP-18 reversed-phase silica gel (YMC), and Sephadex LH-20 (Pharmacia). TLC was carried out with precoated silica gel plates (GF-254, Qingdao Haiyang Chemical Co., Qingdao, China). All solvents were of analytical grade.

#### 3.2. Algal Material

The brown alga *Dictyopteris divaricata* was collected off the coast of Yantai (lat.  $37^\circ 31' 15''\text{N}$ , long.  $121^\circ 26' 59''\text{E}$ ), Shandong Province, China, in July 2008. It was identified by one of the authors (Nai-Yun Ji) and a voucher specimen (MBA0807) has been deposited at the Bio-Resource Laboratory of Yantai Institute of Coastal Zone Research, Chinese Academy of Sciences.

#### 3.3. Extraction and Isolation

Dried and powdered alga *D. divaricata* (2 kg) was extracted with a mixture of  $\text{CHCl}_3$  and MeOH (2 L, 1:1, v/v). The concentrated extract was partitioned between  $\text{H}_2\text{O}$  and EtOAc. The EtOAc-soluble fraction (90 g) was fractionated by silica gel column chromatography (petroleum ether (PE)/EtOAc gradient) to give ten fractions, I-X. Fraction III, eluted with PE/EtOAc (50:1), was further purified by silica gel column chromatography (PE/EtOAc 10:1) to afford **4** (ca. 30 g). Fraction IV, eluted with PE/EtOAc (20:1), was further purified by silica gel and Sephadex LH-20 ( $\text{CHCl}_3/\text{CH}_3\text{OH}$ ) column chromatography to afford *4 $\beta$ ,5 $\beta$ -epoxycadinan-1 $\beta$ -ol* (**1**, 0.8 mg). Colorless oil;  $[\alpha]_{\text{D}}^{21} -8.2^\circ$  (c=0.13,  $\text{CHCl}_3$ ); IR (KBr)  $\text{cm}^{-1}$ : 3471, 2954, 2923, 2877, 1450, 1392, 976;  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ , 500 MHz) and  $^{13}\text{C-NMR}$  ( $\text{CDCl}_3$ , 125 MHz): see Table 1; HRESIMS  $m/z$ : 261.1825  $[\text{M}+\text{Na}]^+$ , calcd. for  $\text{C}_{15}\text{H}_{26}\text{O}_2\text{Na}$ , 261.1830. Fraction VII, eluted with PE/EtOAc (2:1), was further purified by Sephadex LH-20 ( $\text{CHCl}_3/\text{CH}_3\text{OH}$ ) and RP-18 ( $\text{CH}_3\text{OH}/\text{H}_2\text{O}$  3:1) column chromatography and preparative TLC (PE/EtOAc 3:1) to afford **3** (11.0 mg), **5** (2.1 mg), **6** (14.0 mg), and **7** (8.0 mg). Fraction VIII, eluted also with PE/EtOAc (2:1), was further purified by Sephadex LH-20 ( $\text{CHCl}_3/\text{CH}_3\text{OH}$ ) and RP-18 ( $\text{CH}_3\text{OH}/\text{H}_2\text{O}$  3:1) column chromatography and preparative TLC (PE/EtOAc 1:4) to afford **2** (20.7 mg).
